

## **DRYWALL JOINT FIXTURE AND METHOD**

### **ABSTRACT OF THE DISCLOSURE**

A drywall-joint fixture has a drywall-joint cover (1, 33, 37, 42) that can be attached to a drywall arch, wall flat or other drywall structure after a first sheet (3) and a second sheet (4) of drywall of the drywall joint are positioned on wall framework (5, 35, 39) of a building. A paper face (49) that is resistant to sanding is positioned on the drywall-joint cover. The drywall-joint cover includes a first side (6), a second side (7) and an attachment flange (8). The attachment flange is extended orthogonally from an inside surface of either the first side or the second side and is longer than a side opposite from which it is extended for receiving fastener shanks (12) that are stuck through sheets and into a wall framework. A selection of shapes are provided for differing wall structures. A method includes using the attachment flange to maintain the drywall-joint cover in place.
